

The Laboratory of Chemical and Environmental Engineering (LEQUIA) is a research group of the University of Girona (Catalonia, Spain) devoted to the development of eco-innovative environmental solutions. Our research lines are: 1) innovative processes for (waste)water treatment and potabilization; 2) gas treatment and carbon dioxide bioconversion and 3) digitalisation and application of artificial intelligence in the urban water cycle. LEQUIA is fully committed to transfer its research outputs and has a long track record of RDI collaborations with business organizations and entrepreneurship projects, including the foundation of two spin-off companies (SISLTech and Ecomemb).

If you want more information about it, you can find us at Hall 8.1, University Spin-Off Zone, with the University of Girona (8.1C32). We are open to meetings!
