Newronia develops AI-powered optimization for logistics, focused on route and task planning under complex constraints.

Our latest innovation is a driver-trained AI: we learn from historical driver decisions, local know-how, and execution data to generate routes that match how operations really run.

Combined with advanced genetic algorithms and local search, we deliver plans that are efficient and also practical, consistent, and easy to execute. We build tailored projects and integrations to fit each customer's workflows, reducing manual planning and improving service reliability.

If you want more information about it, you can find us at Hall 8.1, University Spin-Off Zone, with the University of Girona (8.1C32). We are open to meetings!
