

Mobile Device Identity Registration System

About MIRS

> MIRS is a patented technology proven to be the most effective solution to eliminate counterfeit devices and stop illegal importation of any Sim-enabled device.

> InMobiles is a pioneer in the market with over 6 years of experience in MIRS deployments. It is the only company having a current live nationwide centralized solution.

Key Benefits

Maximizes the collection of Customs and VAT revenues as a result of ceasing illegal device importation and wrong declarations;

Prevents counterfeit mobile phone market (Non GSMA compliant, fake and cloned) from accessing the network;

Protects the interest of consumers against all fraudulent devices and health hazards;

Enhances Network performance and improves the quality of telecommunications;

Discourages mobile phone theft by prohibiting their access to the network;

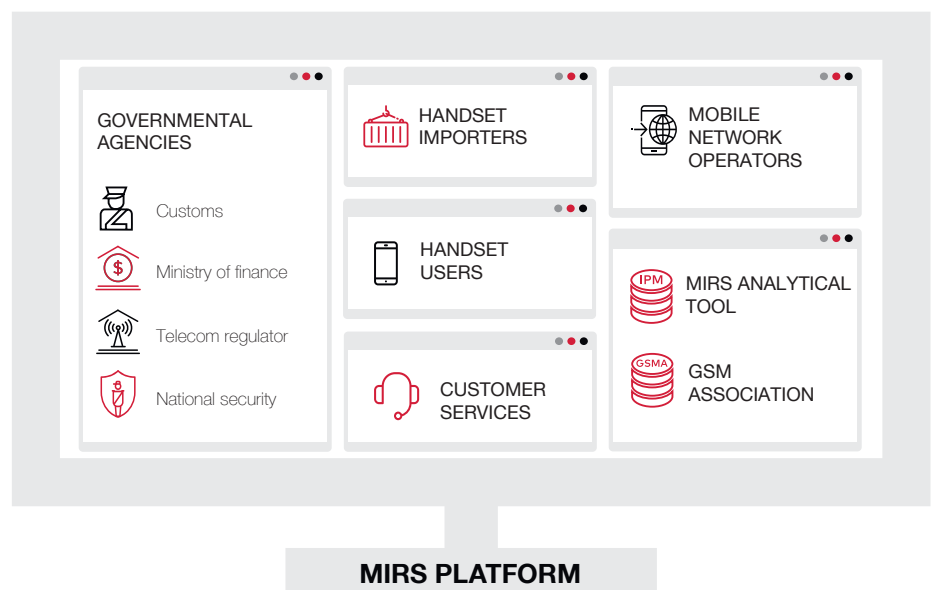

Optimizes national security and maintains a nationwide registry of all equipment identities for precise statistics and profiling of mobile terminals.

Need to stop illegal device Importation and maximize tax collection?

Taxes are the most important sources of federal revenue all over the world, and they are mainly generated from importation of goods. Governments intend to regulate all aspects of importations to maximize revenues, create a fair-trade market and influence economic and industrial development. However, importers attempt to evade paying taxations and customs duties by illegally importing goods into the country. Counterfeits, stolen, cloned and fraudulent devices are prevalent, which results in an enormous expansion of black-market activities, and this practice became a source of massive revenue loss and potential of security issues.

To address these concerns, InMobiles has innovated a Centralized Device IMEI Detection and Registration System "MIRS" that is expected to increase the tax revenue of imported devices by over hundred-fold. The system integrates the mobile operators with the customs and regulatory agencies to prevent any device either illegally imported, cloned, stolen, or fake from accessing the networks.

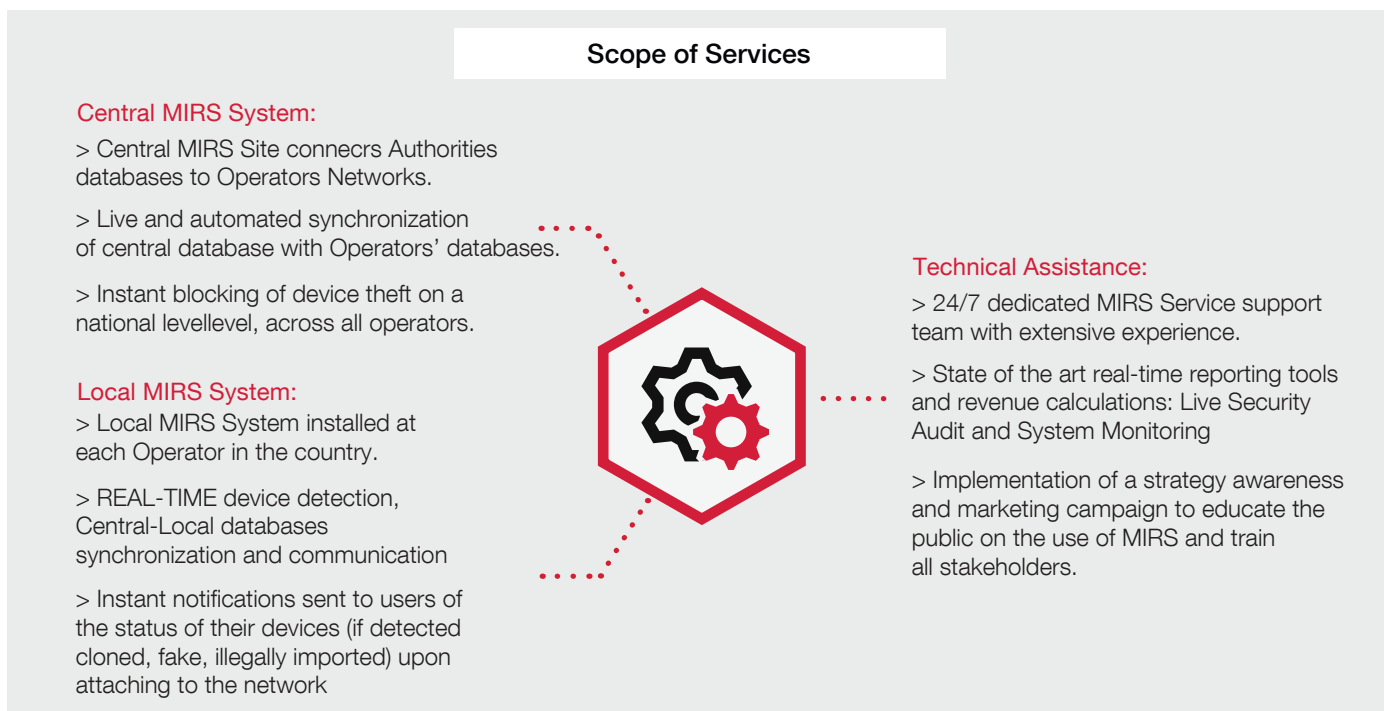

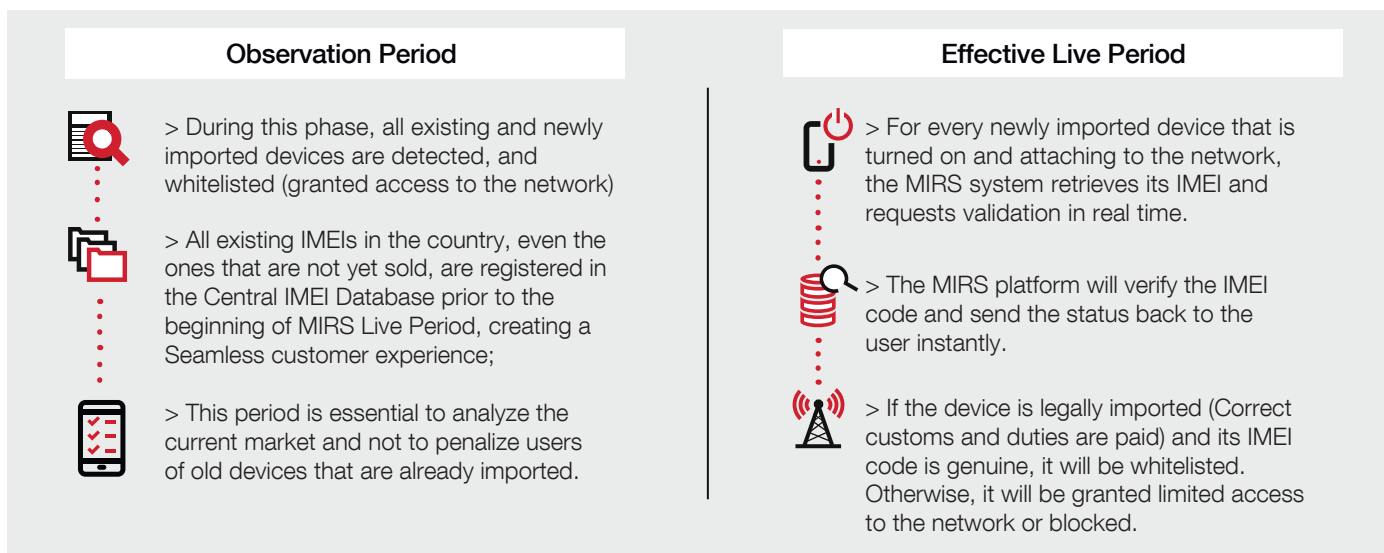

MIRS relies on a live and automated IMEI synchronization between the mobile operators and the central site, enhancing the country's security, and providing control to the Government.

A smart digital scanner to control illegal importation of devices

InMobiLES' MIRS solution ensures that only legally imported and genuine SIM-enabled devices are granted access to the networks and can function properly. The system operates in multi-steps:

- > Observation Period that can last up to 90 days during which all IMEI codes are detected and All existing sim-based devices in the country are whitelisted
- > Effective Period is the live real-time monitoring period during which newly imported devices are validated and registered to guarantee devices' authenticity and ensure all customs duties and vat are adequately paid.

About InMobiLES

InMobiLES, founded in 2006, has gradually established itself as one of the leading providers of mobile technologies and governmental solutions in the Middle East and Africa. With its engineering hub based in Beirut and over 8 international offices, InMobiLES is able to assist Telcos and Governments worldwide in shaping their innovations with its competitive edge solutions and has successful records and footprints across the African, Asian, and American regions.

Our solid R&D and technical knowledge, innovative ideas, high quality of services and quick time to market is what sets us apart.
