

Integrating New Solutions at Simon & Schuster with Adaptigent

BUSINESS CHALLENGE

Publishing giant Simon & Schuster was founded in 1924 and its operations have evolved over the decades. The publisher sought to enhance its IT environment by incorporating Windows Server® and the Microsoft .NET Framework® alongside its existing mainframe infrastructure.

Saying Dave Schaeffer has a challenging job is an understatement. Simon & Schuster's Vice President of Distribution and Fulfillment oversees the publisher's distribution of 262 million books annually—amounting to 1.9 million orders and 5,000 tractor-trailer truckloads of books each year. If these trucks were parked end to end, they would cover the length of the highway from the business's Philadelphia-based location to New York City.

This is just a part of what Schaeffer handles at the publisher. He must also stay updated on any and all challenges taking place with his colleagues who manage the company in a consumer-driven industry.

CHALLENGE

Modernizing the mainframe while preserving existing applications

SOLUTION

Adaptigent's Intelligent Transformation Platform and Fujitsu Software NetCOBOL

“If an author does well on ‘60 Minutes,’ we get a sudden rush of orders that has to be fulfilled immediately. That’s just a small example of what we call ‘extreme publishing,’ reducing the cycle time for every aspect of publishing, from authoring to getting the published book into the customer’s hands,” Schaeffer explained.

“Processes that used to happen once a day now have to happen several times a day. That not only requires doing things faster, it requires doing them differently—such as integrating our order processes with those of our customers on one end, and our distribution processes with those of our distribution partners on the other end.”

As business needs evolved, Simon & Schuster sought solutions that could provide enhanced flexibility and faster processing times while seamlessly working with their existing systems. These systems were not designed to support the type of agility Simon & Schuster needed from its IT solutions.

Schaeffer explained that shipping books on an on-demand basis was simply not feasible given that the universal order processing system only allowed morning and midday shipments. With increased demand, the company explored opportunities to streamline their processing cycles and ensure faster delivery times.

| SOLUTION

Anne Lloyd Davies, Chief Information Officer at Simon & Schuster, said a UNIX-based solution would have necessitated code re-engineering that was costly. The publisher also considered an ERP system, but that was simply too expensive.

Simon & Schuster decided that Fujitsu Software NetCOBOL, and Adaptigent’s Intelligent Transformation Platform were the most cost-effective options.

These tools allowed the publisher to preserve traditional business logic by porting existing applications to native Microsoft .NET code. This process would allow Simon & Schuster to preserve the original business logic, written in CICS/COBOL, that was familiar to end-users.

“If an author does well on ‘60 Minutes,’ we get a sudden rush of orders that has to be fulfilled immediately. That’s just a small example of what we call ‘extreme publishing,’ reducing the cycle time for every aspect of publishing, from authoring to getting the published book into the customer’s hands,”
